

Loop Idioms: What We Do in Loops

Note: Even though these examples are simple,
the patterns apply to all kinds of loops

Making “smart” Loops

The trick is “knowing” something about the whole loop when you are stuck writing code that only sees one entry at a time

Set some variables to initial values

for **thing** **in** **data**:

Look for something or do something to each entry separately, updating a variable

Look at the variables

Looping Through a Set

```
print('Before')
for thing in [9, 41, 12, 3, 74, 15] :
    print(thing)
print('After')
```

```
$ python basicloop.py
```

Before

9

41

12

3

74

15

After

What is the Largest Number?

What is the Largest Number?

74

largest_so_far

74

What is the Largest Number?

15

74

What is the Largest Number?

3 41 12 9 74 15

74

Finding the Largest Value

```
largest_so_far = -1
print('Before', largest_so_far)
for the_num in [9, 41, 12, 3, 74, 15] :
    if the_num > largest_so_far :
        largest_so_far = the_num
        print(largest_so_far, the_num)

print('After', largest_so_far)
```

```
$ python largest.py
```

```
Before -1
```

```
9 9
```

```
41 41
```

```
41 12
```

```
41 3
```

```
74 74
```

```
74 15
```

```
After 74
```

We make a variable that contains the largest value we have seen so far. If the current number we are looking at is larger, it is the new largest value we have seen so far.
